

Stack Overflow 2023 Survey Analysis

The Stack Overflow 2023 Survey Results Exploration and Analysis project aimed to delve into the extensive dataset provided by the Stack Overflow survey conducted in 2023. The project focused on preprocessing the raw survey data, organizing it into meaningful categories, and laying the groundwork for in-depth analysis.

The initial phase involved data preprocessing, which addressed various challenges such as inconsistent data types, missing values, and columns with multiple-choice responses. Techniques like data type conversion, handling missing values, and creating dummy variables were employed to ensure the data was clean and structured.

Subsequently, the data was divided into distinct categories based on the nature of the information captured. These categories included basic information about respondents, their education, work, and company details, insights into industry culture, perceptions and interactions regarding artificial intelligence, and aspects related to work culture.

The preprocessed data was then exported into separate CSV files, facilitating further analysis using SQL or other analytical tools. This structured approach enabled efficient data handling and laid the groundwork for deeper insights into various aspects of the developer community as captured by the survey.

In future stages of the project, the preprocessed data will be further analyzed using SQL queries to uncover trends, patterns, and correlations within the dataset. Additionally, there are plans to develop a professional dashboard website to visualize and present the key findings and insights derived from the survey data.

Overall, the Stack Overflow 2023 Survey Results Exploration and Analysis project aims to provide valuable insights into the demographics, preferences, and perceptions of developers worldwide, contributing to a better understanding of the developer community and its evolving landscape
